

Game Name: WASTELAND: Mark of the Clay Pool

Team name: Clayheads

- Austin Peterson (apeterson1@wpi.edu)
- Ben Samara (bsamara@wpi.edu)

Genre:

First person sci-fi/fantasy dungeon crawler.

Game Description:

Centuries after a crashed meteor destroys most of the Earth's clay, clay becomes even more valuable than gold. A corporation collected all of the world's clay in a giant cash pool. You, a survivor in the wasteland, discover a map with a MARK leading to the CLAY POOL. The player navigates a dungeon and looks for the mark, dealing with obstacles and enemies along the way. There are clues throughout the dungeon and a keypad, where a code will be entered, unlocking the final room with the final boss. The game is a first person old-school dungeon crawler. Combat requires simply clicking an enemy rapidly.

Technical Features:

- We used Professor Claypool's provided Dragonfly engine.
- Navigatable first person map, using a grid system. Each "room" is one square on the grid. For example, some grid squares might have an enemy or a clue.
- The player turns using the left and right keys, then moves forward using the up key. Every time the player turns they see a new background sprite.
- Each wall or hallway of the square the player is in has a different background sprite to show the player they are looking at a different wall or hallway.
- The player can only see the square they are currently in.
- Simplified enemy combat, where the player tries to quickly click an enemy until it falls. The enemy will hurt the player over time, with the sprite flashing to show when it attacks the player. This makes the player motivated to kill it quickly.
- The enemies are sprites placed over the background sprite at certain hallways. They do not move around the map and stay only at their set position.
- When a player is looking at an enemy they are locked and cannot move.
- At the bottom of the screen is a UI showing the player's HP and a map of the dungeon.
- If HP becomes 0, the player dies and must replay the game from the beginning.
- Behind a locked door is a boss fight, which is similar to the combat of the other enemies but more difficult. To unlock the door, the player will find numbers of certain colors around the area and an order of the colors. This becomes a code that the player must input to enter the boss room (9-6-2-7 (WMCP) blue, yellow, green, red).

Artistic Assets:

- 4 wall background sprites (height: 18chars, width: 80chars)
- 4 hallway background sprites (height: 18chars, width: 80chars)
- 4 clue sprites (h:10 w:9)
- 3 fountain sprites (full/empty/highlighted) (h:10 w:19)
- 2 enemy sprites (normal and hit) (h:7 w:23)
- 2 boss sprites (normal and hit) (h:10 w:25)
- 4 clay pool sprite/victory screen (for different colored layers) (h 13: w:33)
- UI background sprite (h: 8chars, w: 82)
- Minimap sprite (for UI) (h: 6 w:49)
- Reticle sprite (h:2 w:2)
- Main Menu sprite (h: 20 w:68)
- Story Crawl sprite (h: 12 w:60)
- Game Over sprite (h: 5 w:54)

Sounds (.wav):

- boss-damage
- boss-death
- drink
- enemy-damage
- enemy-death
- hurt (player damage)
- keypad (button input)
- keypad-correct
- keypad-incorrect
- step
- sword (click/attack)
- turn

Music (.wav):

- music-boss (boss battle)
- music-enemy (enemy combat)
- music-exploration
- music-exposition (opening story title crawl)
- music-gameover
- music-title (main menu)
- music-win (game victory)

Implementation Plan:

- -First create map and grid system with a sample map
- -Create background sprites
- -Start with a 3x3 room to test looking around and moving
- -Create UI sprites
- -Create and test UI, log, and HP
- -Create enemy sprites
- -Next implement combat (enemies moving, clicking on them, playing animation, enemies attacking and player health going down, enemies being defeated, player death)
- -Create all object sprites (fountain, number clues, door, lock)
- -Then test having objects over the background sprites
- -Next create and test fountain objects
- -Next create and test door and keypad
- -Once all room objects work, create the full layout of the map
- -Add map to UI
- -Create boss sprite
- -Create clay pool sprite
- -Next implement boss fight
- -Implement startup and end screens
- -Create sound files
- -Implement sounds
- -Create music
- -Implement music

Distribution of Work:

Austin:

Alpha:

- -Create UI sprites
- -Create and test UI, log, and HP
- -Enemy sprite
- -Enemy movement
- -Player attack
- -Enemy death

Final:

- -Fountain Sprite
- -Fountain mechanics
- -Colored clue numbers sprites
- -Color code sprite
- -Create sound files
- -Implement sounds
- -Create music
- -Implement music

Ben:

Alpha:

- -Create background sprites
- -Create map and grid system with a sample map
- -Enemy attacking
- -Player death (game over/restart)

Final:

- -Add map to UI
- -Keypad Sprite
- -Keypad entry for lock/door mechanics
- -Expand map to designed level map
- -Create boss sprite
- -Next implement boss fight
- -Create clay pool sprite
- -Implement startup (title screen, controls, and story text) and end screens

Meetup before we start Final phase:

-Design map and object locations within that map (enemies, fountains, clues)

Schedule:

--Start Alpha--

- Create background sprites
- Start with a 3x3 room to test looking around and moving
- Create UI sprites
- Create and test UI, log, and HP
- Create all object sprites (fountain, number clues, door, lock)
- Then test having objects over the background sprites
- Create enemy sprites
- Next implement combat (enemies moving, clicking on them, playing animation, enemies attacking and player health going down, enemies being defeated, player death)

--Alpha due--

- Next create and test fountain objects
- Next create and test door and keypad
- Once all room objects work, create the full layout of the map
- Add map to UI
- Create boss sprite
- Next implement boss fight
- Create clay pool sprite
- Implement startup and end screens
- Create sound files
- Implement sounds
- Create music
- Implement music

--Final due--
